# TIST Leadership Council has expanded: Regional Representatives now incorporated.

TIST is continuing to grow, and we are finding new ways to organize to be sure all TIST voices are heard. The Group of Cluster Councils elected representatives to the Regional Councils for eight (8) TIST regions. These include;

1. Laikipia West, Nyahururu , Wiyumiririe
2. Narumoro , Lamuria
3. Timau and part of Ntugi

## HIV and AIDS: Why and how we should give counseling

**C**ounseling means listening to someone and giving them helpful advice and hope. It is true that some issues need trained counselors. However, each of us can help by taking time to listen to friends, family and neighbors with HIV/AIDS, putting ourselves in their position, and giving words of comfort and practical help.

### The purpose of counseling is to:

- Assist someone to understand the problems facing him/her
- Help find ways of overcoming those problems
- Making good, correct decisions concerning the problems at hand.

The responsibility of the counselor is to sit with the concerned and to **listen**. Listen to their questions; discuss their problems, hear about their feelings and fears of what has happened to them. Give them correct and useful information depending on their needs, and give them hope and strength. Remember: it is fine if we do not know all the answers! Answer as best you can and get help from other people when you need it.

Imagine you are counseling an AIDS patient. What would your words of comfort and advice be to:

1. Someone who has just tested HIV positive.
2. Someone with HIV/AIDS who is scared of death.
3. Someone with HIV/AIDS who wants to continue having sex?

### Ideas:

1. For someone who has just tested positive
  - Reassurance that being positive does not mean the patient is necessarily going to die soon. Patients can live decades with the right treatment and care.
  - That the patient is not alone, and many others have found ways to live with the illness.
  - To encourage the patient to abstain from sex so that the illness does not spread and to avoid re-infection which can make the problem worse.

- Encourage to continue with work while they are strong, to continue making an investment for their family. People do not have to stop working just because they are positive.
- Reminders of healthy eating and frequent check-ups at clinics.

- 2 For someone who is HIV positive who is scared of death

- Everyone has to face death whether having AIDS or not, and it is natural to feel afraid.
- Draw on any religious hope the patient might have.
- Remind the patient about how proper care and treatment can extend life and improve quality of life.
- Encourage the patient to make steps to achieve some of their ambitions before they become too ill (e.g. making restitution with people, planting trees, forming self-help groups)

- 3 For someone who is HIV positive who wants to continue having sex

- Continuing to have sex can spread the illness on to other people. Even if the patient got AIDS by accident, making other people suffer will not bring happiness or change the situation.
- There are many different strains of the HIV virus. Continuing to have sex may expose the patient to different strains which worsen illness and create complications. Avoid re-exposure to HIV to remain as strong as possible.
- How does the patient view deliberately infecting another person? What are the moral arguments against this?
- Remind the patient that sex is not the only form of intimacy or enjoyment, nor the only expression of love. There are many other things in life that can bring fulfillment.

# Preparing Compost Manure, a natural fertilizer.

This compost manure is a natural fertilizer to help your crops grow. It is better than chemical fertilizer because it is natural, free, and will not damage crops and environment as some chemical fertilizers can. There are many ways to make compost manure. This method has been useful in some areas, but ask neighbors in your cluster what has worked well for them.

## Preparation of compost

1. Choose an area for your compost pit. It should be 4m by 4m.
2. Clean the area.
3. Dig a hole of diameter 3 - 4m and 1.5m deep.
4. Collect all the remains of the crops you have (e.g. the leaves and stalks of maize, millet, beans). Cut these remains into small pieces.
5. Put these crops remains into the hole up to a depth of 0.5m.
6. Then add 5 litres of ash.
7. Next add about 30cm (or as much as available) of animal dung (e.g. dung from pig, cow, goat or chicken).
8. Next put another layer of crop leaves and stalks (0.5m)

9. Add another 5 litres of ash.
10. Add the leaves and stalks again until the hole is almost filled.
11. Finally add a layer of soil until the hole is filled.
12. Whilst filling the hole with soil, put a long stick in the middle of the hole so it reaches the bottom.
13. Leave the compost pit for 90 days (3 months).
14. During this period use your dirty water to water the compost pit. For example, after cleaning your house or clothes, empty the used water over the compost pit. If you have animals, you can also pour animal urine over the pit. This adds extra nitrogen to the compost.
15. Try to water the compost pit in this way every day, or whenever water is available.
16. After the 90 days the manure will be ready. Use the stick as a thermometer – when the compost is ready it should be hot and you may even see steam coming from the stick after you have removed it.

## Use of compost

When you have dug your holes for planting maize, millet or other crops, add one handful of compost to each hole.

# Karoki Cluster, A child Cluster growing day by day.

We, Karoki Cluster, multiplied from our mother cluster Manyatta. By multiplying, and being sure that groups are within walking distance of a meeting point, we are better able to serve all TIST members in the cluster, and to grow for success!

Today, we have 33 Small Groups. Each day, we are getting requests from neighbours to join TIST. We will soon have 50 Small Groups in our Cluster.

We are preparing ourselves to establish more nurseries. We have agreed that each group should have at least 1 nursery. Our goal is to attain 100,000 trees planted and kept alive this year.

Today, 30 Small Groups in our cluster receive payments. This means more groups are meeting TIST Small Group payment eligibility. We want to be the leading Cluster by the year 2013!

# Deforestation and forest land degradation are serious problems. What can we do?

**Deforestation is the removal of trees and other woody vegetation cover.**

**F**orests and woodlands cover about a third of the world's land surface. They regulate climate, protect water resources, provide forest products (e.g. timber, medicine, fruit etc) worth billions of dollars and support millions of plant and animal species. Yet they are being destroyed at a rate of 20 million hectares per year. Half of the world's population depends on these forests for fuel, yet roughly 100 million people do not have enough fuel for minimal energy requirements.

## Major causes of deforestation :

- Deforestation occurs when vegetation is cleared for activities like farming or grazing and uses such as: firewood, brick-making, fish-smoking, tobacco-curing, tea-drying, construction, and timber.
- Forest degradation is when a forest becomes less diverse and resilient due to poor use and management (for example, when old trees are all cut, leaving mainly brush, or when a useful plant species is all harvested, or when forest is heavily grazed, so that trees can't grow to replace those that die).
- Much of deforestation and forest land degradation results from a lack of awareness of the full value of trees.
- In some cases, the value of trees may be known but poverty and the idea that there are no good alternatives lead people to clear trees.

## Consequences of Deforestation.

- **Soil erosion:** lack of tree cover and root binding exposes soil to erosion.
- **Lack of forest resources:** removing trees destroys habitats, reduces biodiversity, removes food and medicinal resources, and increases competition for construction materials. People

will have to walk further for firewood, and if forest products are being bought, prices will rise.

- **Lack of other environmental benefits of trees:**

Trees act as a windbreak, retain moisture, add oxygen to the air, and add nutrients to soil. Hence without trees the local climate will become drier with increased risk of flooding, wind erosion, decreasing soil fertility and diminished air quality.

## What can we do to prevent deforestation and forest degradation?

- Establish tree nurseries and distribute or sell seedlings to the community.
- Use energy-saving cook stoves that use less firewood and charcoal.
- Use alternative sources of energy and fuel when possible (e.g. heating from the sun, sawdust, coffee and risk husks, grass, weeds, crop wastes, animal waste).
- Carry out tree planting activities. Become a successful, effective TIST group! Encourage your neighbors and friends to join TIST as well.
- Do not cultivate land bordering a river or swamp. Leave trees and vegetation to grow to protect these waters.
- Be careful to not over-graze land. Limit animals' access to tree seedlings that they may destroy to give the forest a chance to regrow.
- Encourage agro-forestry or the use of woodlots. Having trees on your land provides good access to forest products and helps protect nearby forest.

## TIST improved stove testimonials.

Since the improved jiko program began, TIST servants have become passionate leaders to bring these jikos to more and more TIST clusters. These TIST servants have done careful testing on several different stoves to ensure the stoves give important benefits to the users.

This month, Ms. Dorothy Naitore (Leadership Council Member), Mr. Charles Kamunya and James Mwai (Improved Jiko Coordinators), and Ms. Salome Mbaabu (long time TIST stove builder) share with us some results.

Dorothy: "With the Jikopoa, I can cook for 4 people using only 4 kg of fuel per day. Also, it is very fast. Boiling 1 liter of milk takes only 5 minutes, 4 liters of tea takes only 10 minutes, and I can cook mashed foods like Githeri for 5 people in just 45 minutes."

Dorothy has also tested a new 2 pot jiko with a chimney. She estimates that, by switching from using gas and charcoal fuel to using wood fuel on these improved stoves, she has gone from spending 4,200 ksh/ month to just 900 ksh per month on fuel. In this way, improved stoves pay for themselves quickly.

James, Charles and Salome also tested 3 stone fires and compared them to the 2 pot mud stoves. In each case, they saw between 20-50% fuel savings.

TIST is now taking orders for improved stoves. Costs of the stoves have gone up over the last year, as manufacturing and transportation costs have risen. However, members should see big savings in fuel-costs that make up for these increases. As always, TIST will work hard to keep low cost and big results!

### IMPROVED STOVES AVAILABLE FOR PURCHASE

#### Portable Manufactured Stoves.

Jikopoa: 1,400 ksh

Envirofit G-3300: 2,500 ksh
