Energy saving cookstove that reduce smoke in the Kitchen

Energy saving cookstove with a smoke chimney to direct the smoke outside the kitchen

The TREE is a monthly newsletter Published by **TIST** Uganda, a project area of **The International Small Group** and **Tree Planting Program**.

MISSION STATEMENT:

TIST Uganda is a community initiative dedicated to empowering small groups of subsistence farmers to combat the devastating effects of deforestation, poverty and drought.

OBJECTIVE STATEMENT:

Combining sustainable development with carbon sequestration, TIST supports the reforestation efforts of over 25,000 subsistence farmers. Sales of carbon credits generate participant income while TIST today also addresses Agriculture, HIV/AIDS, Nutrition and Fuel Wood challenges.

IN THIS ISSUE:

- IMPROVED ENERGY SAVING COOK STOVES
- INDIGENOUS TREES ARE GOOD
- OTHER SOURCES OF INCOME FROM TIST TREES
- THE IMPORTANCE OF BOUNDARY TREE PLANTING.

ENGLISH

IMPROVED ENERGY SAVING COOK STOVES

This is the modern and less fire wood consuming cook stove used by many people in our District Rukungiri.

It is helpful in cooking because materials are available in our area.

1. **Materials used are**, water, soil (ant hill), Ash, dry grass, cow dung , bricks, sand(local), pieces of fresh banana stem.
2. **How to make it,**
 - Dig an anti-hill about 3 wheel barrows.
 - Get one and a half wheelbarrow of local sand.
 - One basin of cow dung (fresh)
 - Collect Ash of one basin
 - Get water and mix them together
 - Turn it after one week
 - Get a piece of banana stem and place to at the fire gate and where the pan will be placed and where smoke will pass.
 - Allow the mud to stay for a month.

ADVANTAGES

- It's hygienic
- It is cheap because materials are locally available.

- Not hot because of the chimney which takes out smoke.

- More meals are cooked with less fire wood.
- Controls deforestation.

*By cluster servant Caleb Turyamureeba Rukungiri
District specialist in construction.*

CROP ROTATION

This is the growing of different crops in the same piece of land season after season (at different times).

And crops grown in gardens with less fertility will yield less and look weak hence little harvest.

This practice prevents and controls pests and diseases by breaking their life cycle.

It also recovers or adds nutrients into the soil.

INDIGENOUS TREES ARE GOOD

Oh, what good news! Planting indigenous trees is very useful to my land. This season the rains are heavy and the atmosphere is always intense. I would have experienced the landslides and heavy soil erosion, but the planting of stinkwood and Markhamia protected my farm from these dangers. The trees are quick to grow and cover the land as they shed their leaves. These leaves decompose and form organic manure that improves their

growth and the soil.

We were trained that some indigenous trees are medicinal. I learned the trees can have other benefits as I established the nursery bed of Stinkwood. The strong smell scares away ants and mosquitoes, which used to disturb me. Local people often prefer indigenous species for a variety of uses such as charcoal, furniture, housing material, and medicine to mention just a few. Clearly, indigenous species are valuable. It is good to see my neighbors come to understand this value and to plant indigenous tree species.

I am planning to plant more than 100 trees this season on my own land and put many more in pots for my group members use to increase the number of stinkwood trees in our group.

Indigenous trees are really good looking. I encourage everyone to plant them. Also, plant fruit trees for their nutritious fruit and benefits to our bodies and money from fruits sold.

We shall continue to plant indigenous tree species because these species:

Are well suited to local environment in which they have grown for years;

Are known and respected by the users;

Can help us achieve big results at low cost when

we gather seeds and wildlings from local trees;

Provide diverse, beneficial products that many exotic species cannot

Indigenous trees are good! Let's all plant them.

Ndyabawe Carl Peters, Ababarisa Group, Kabale

OTHER SOURCES OF INCOME FROM TIST TREES

My name is **Nigo Iddi** from Namirembe village, Namirembe Parish, Busaana Subcounty, Kayunga District from Namirembe cluster. I am TIST farmer from a small group called Namirembe community Agenda 1. I joined TIST since 2016 with a motive of money oriented factor, that is carbon money, but before that money I have benefited more in selling fruits like mangoes, oranges, firewood from tree branches, getting money from some of the fire wood. All that knowledge I got from TIST. I am grateful that even if the carbon money delays, I have other sources of getting money because of TIST.

TIST does not discriminate the gender, education level, rich or poor. So, I advise everyone to join TIST for better livelihood.

By Nigo Iddi from Namirembe Cluster –Kayunga District

RUNYAKORE

THE IMPORTANCE OF BOUNDARY TREE PLANTING.

Boundary tree planting is where farmers plant trees along the boundaries of their land. There are several tree species that can do well with system of farming; they include gravelia, stinkwood, pine and the majority of the fruit trees.

It's an important system of farming and encouraged among TIST farmers because it's environmentally friendly.

These trees planted along the boundary tend to act as demarcations amongst different farmers.

Trees planted along the boundaries tend to act as windbreaks to the rest of the garden especially during periods of heavy rains and strong wind.

They also act as a fence to the garden.

These trees also generate a lot of income to the farmers through fruits harvested, carbon benefits and also through the sale of other wood related products.

It would therefore be wise if all our Farmers engaged in this system of farming.

By Andrew Arinda.-Cluster servant Kanungu and Katojo.

AMAHEGA GARIKUKORESA ENKU NKYE

Aga ni amahega g'omurembe garikutwara enku nkye agarikukoresibwa abantu baingi omuri Rukungiri.
